

Heating controls via mobile interface:

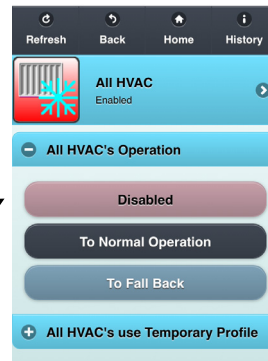

Note: ALWAYS use these buttons to navigate pages rather than the native browser back and forward controls

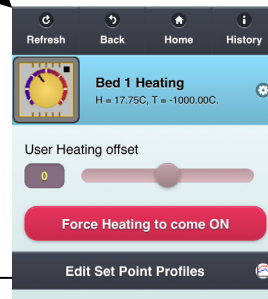

Home Page
(content extent will vary depending on feature set of your system)

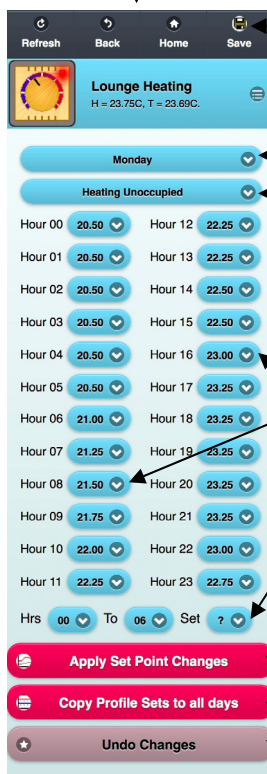

Heating related categories
HVAC = 'Thermostat'
Number of HVACs listed depends on your installation

These controls allow adjustment of overall heating function, e.g to disable the heating altogether or to operate all thermostats on a 'fall back' set point e.g when away for long periods

This page is generally used for temporary adjustments to a specific HVAC (thermostat). The slider allows the user to adjust the current set point relative to the defined profile. Force heating .. button will make Cortex decide what to do to force the heating on/off despite any automation decisions currently preventing this. The control at the bottom provides access to the baseline profile editor

5. After you are satisfied with ALL changes this button allows you to save the entire database to the disk file, such that if the system goes down for some reason then changes will be preserved

1. Select day (can also specify week days or weekend)

2. Select Profile type(heating/cooling, occupied/unoccupied). Obviously no point selecting any cooling profiles if you don't have a cooling mechanism

3a. Allows changing of set point values for individual hours of the presently selected profile. Changes are lost if you change profile set through 1 or 2 above, or if you navigate away from the page entirely. To make the changes take effect in Cortex **MUST** use the Apply Set Point Changes button below (4)

3b. Allows setting a particular set point value across a range of hours. Generally more convenient than 3a. First select the hours range, then select the set point value. You can then select a different hours range and a different set point value for that, etc. Changes don't take effect in Cortex until you click the Apply button

4. After completing adjustments for a particular profile set you must click this button in order for these to actually take effect

Optional. Copies the full set of profiles for the selected day/s to all other days

Optional. Allows you to undo any applied changes (to last configuration saved to the disk file)
